

Transactions

The transactions API exposes the ledger transactions of a financial account.

 The initial call to the transactions API can sometimes time out with accounts that have an abnormally large number of transactions. Should this happen wait a few seconds and try again.

Properties

`account_id` string

The id of the account that the transaction belongs to.

`amount` string

The signed amount of the transaction as a string.

`date` string

The ISO 8601 date of the transaction.

`description` string

The unprocessed transaction description as it appears on the bank statement.

`details` object

An object containing additional information regarding the transaction added by Teller's transaction enrichment.

`processing_status` string

`category` string (nullable)

The category that the transaction belongs to. Teller uses the following values for categorization: `accommodation`, `advertising`, `bar`, `charity`, `clothing`, `dining`, `education`, `electronics`, `entertainment`, `fuel`, `general`, `groceries`, `health`, `home`, `income`, `insurance`, `investment`, `loan`, `office`, `phone`, `service`, `shopping`, `software`, `sport`, `tax`, `transport`, `transportation`, and `utilities`.

`counterparty` object

An object containing information regarding the transaction's recipient

`name` string (nullable)

The processed counterparty name.

`type` string (nullable)

The counterparty type: `organization` or `person`.

`status` string

The transaction's status: `posted` or `pending`.

`id` string

The id of the transaction itself.

`links` object

An object containing links to related resources. A link indicates the enrollment supports that type of resource. Not every institution implements all of the capabilities that Teller supports. Your application should reflect on the contents of this object to determine what is supported by the financial institution.

`self` string

`account` string

A link to the account that the transaction belongs to.

`running_balance` string (nullable)

The running balance of the account that the transaction belongs to. Running balance is only present on transactions with a `posted` status.

`type` string

The type code transaction, e.g. `card_payment`.

`GET` /accounts/:account_id/transactions

List Transactions

Returns a list of all transactions belonging to the account.

Pagination

The Transactions endpoint returns all transactions for the given account. Usually this does not represent a large amount of data transfer, but if your application has specific requirements of minimizing the amount of data going over the wire the transactions list endpoint supports pagination controls.

Pagination controls are given as query params on the request URL.

`count` integer

The maximum number of transactions to return in the API response.

`from_id` string

Request

```
curl https://api.teller.io/accounts/acc_oiin624kqjrg2mp2ea000/transactions \
-u test_token_ky6igyqi3qxa4:
```

Response

```
